

Talk Show Script

Young People Are Making a Difference in China

Duration: Approximately 8–10 Minutes

Cast of Characters

Host: Li Hua — A university student and the host of the talk show.

Guest 1: Wang Lei — A 28-year-old courier working in a major city for the past five years.

Guest 2: Zhang Min — A 25-year-old rural teacher who joined the Special Post Teacher Program after graduation.

Guest 3: Chen Bo — A 30-year-old computer engineer specializing in AI applications for healthcare.

Guest 4: Liu Yan — A 27-year-old environmental engineer working on renewable energy projects.

Part I: Opening & Introductions

(The host walks onto the stage, smiling and waving to the audience.)

Host (Li Hua): Good evening, everyone! Welcome to our talk show, 'Young Voices, Real Impact.' I'm your host, Li Hua. Today, we're exploring a fascinating topic: how young people across different professions are making a real difference in China. From the packages arriving at our doors to the technology shaping our future, young people are at the heart of it all. Let's welcome our four amazing guests!

(Audience applauds. The four guests wave and take their seats.)

Host (Li Hua): Let's start with quick introductions. Wang Lei, would you tell us a bit about yourself?

Wang Lei: Sure! I'm Wang Lei, 28 years old. I've been working as a courier for five years. I deliver around 150 to 200 packages every single day. It's a busy job, but honestly, I love it — every package is someone's expectation, and I get to be the one who fulfills it.

Host (Li Hua): Great! Zhang Min, how about you?

Zhang Min: Hi everyone! I'm Zhang Min, 25. After graduating from university, I joined the Special Post Teacher Program and went to teach at a primary school in a remote mountain village in Guizhou Province. I've been there for three years now, teaching Chinese and music to kids from grades one to six.

Host (Li Hua): That takes real dedication. Chen Bo?

Chen Bo: Hello! I'm Chen Bo, 30. I'm a computer engineer focusing on artificial intelligence, specifically AI-assisted medical diagnosis. My team develops algorithms that help doctors detect diseases like cancer and heart conditions earlier and more accurately. We work closely with hospitals across the country.

Host (Li Hua): Fascinating work. And last but not least, Liu Yan?

Liu Yan: Hi! I'm Liu Yan, 27. I'm an environmental engineer. I work on solar and wind energy projects, helping design and optimize renewable energy systems for rural areas. My goal is to bring clean, affordable electricity to communities that need it most.

Host (Li Hua): What an incredible group! Thank you all for being here.

Part II: Questions & Discussion

Question 1: What do you think of your job? Is it what you expected?

Host (Li Hua): Let's begin with a simple but important question for all of you. What do you think of your job? Is it what you expected when you first started? Wang Lei, let's start with you.

Wang Lei: Honestly, when I first started, I thought it would just be riding around and dropping off boxes. I didn't expect it to feel so meaningful. But one experience changed my mind entirely. During a heavy rainstorm last summer, I was delivering medicine to an elderly woman living alone. When she opened the door, she was so grateful she almost cried. She said, 'Young man, you're the only person I've seen today.' That moment made me realize — I'm not just delivering packages. I'm delivering care, and sometimes even hope. So my job is far more than what I expected.

Host (Li Hua): That's a beautiful story. Zhang Min, what about you?

Zhang Min: I would say my job is both harder and more rewarding than I ever imagined. When I first arrived, the school had only two teachers for over 80 students. The facilities were basic — no computers, no music room, and the library was just a shelf of old books. Some kids walked two hours each way just to get to school. But what struck me most was their hunger for knowledge. Their eyes would light up when I told them stories about the world beyond the mountains. I realized that being a teacher here doesn't just mean teaching reading and math — it means opening a window to a bigger world for these children.

Host (Li Hua): That's really inspiring. Chen Bo, your turn.

Chen Bo: Well, I studied computer science because I thought it was cool and well-paid. But after I started working in AI healthcare, I discovered something I didn't expect: the emotional weight of the responsibility. When our algorithm flags a potential tumor that a doctor might have missed, and it turns out to be early-stage cancer that can be treated — that's when I understand the real value of my work. It's not about writing clever code. It's about giving people more time with their families. That's far beyond what I expected when I chose this career.

Host (Li Hua): Powerful. Liu Yan?

Liu Yan: I expected to be working in a lab or a fancy office. Instead, I spend most of my time climbing hills and walking through villages in western China, installing solar panels and checking wind turbines. But honestly, I wouldn't trade it. When we brought electricity to a village in Qinghai that had never had reliable power before, the children there could study at night for the first time. Seeing their faces when the lights came on — that's something no lab could ever give me.

Question 2: What's your career goal? Where do you see yourself in five years?

Host (Li Hua): Let's move to our second question. What are your career goals? Where do you see yourselves in five years? Wang Lei?

Wang Lei: My dream is to become an expert in smart logistics. Right now, I'm studying part-time to learn about supply chain management and data analysis. In five years, I want to help build a more efficient delivery system — one that uses route optimization and smart sorting to make sure every package reaches its destination faster and more safely. I also want to mentor young couriers entering the industry, because I know how tough the first year can be.

Host (Li Hua): So you're not just delivering packages — you're planning to transform the whole system.

Wang Lei: Exactly! The industry is growing so fast. China's express delivery volume exceeded 200 billion packages in 2025. We need smarter systems to keep up.

Host (Li Hua): Zhang Min, what about you?

Zhang Min: My goal is to build a digital learning platform for rural schools. Many village schools still lack access to quality educational resources. I want to connect volunteer teachers from cities with rural students through online classrooms. I've already started small — we have a weekly video call with a music teacher in Beijing. The kids love it. In five years, I hope every child in my county can access online courses in art, science, and English, not just the basic subjects.

Host (Li Hua): That's a wonderful vision. Chen Bo?

Chen Bo: My goal is to make AI-assisted diagnosis available in every county-level hospital in China. Right now, top hospitals in big cities have access to advanced AI tools, but grassroots hospitals — the ones most rural patients rely on — often don't. In five years, I want to develop a lightweight, affordable AI diagnostic system that can run on basic equipment. No village doctor should have to send a patient away just because they don't have the technology to make a diagnosis.

Host (Li Hua): Bridging the gap between cutting-edge tech and grassroots healthcare — that's incredibly important. Liu Yan?

Liu Yan: I want to help China achieve its carbon neutrality goals. My specific dream is to design a community-level renewable energy system — a combination of solar, wind, and energy storage — that can power an entire village independently. In five years, I hope to have piloted this system in at least ten villages across western China. If it works, it could be a model for sustainable rural development across the country, and even in other developing nations.

Question 3: Do you think young people in your field are making a difference to China?

Host (Li Hua): This is the heart of today's topic. Do you believe young people in your profession are genuinely making a difference to China? Zhang Min, let's hear from you first.

Zhang Min: Absolutely. Over 600,000 young teachers have been sent to rural areas through the Special Post Teacher Program in the past 20 years. We're not just filling a staffing gap — we're changing what education looks like in these communities. Before we arrived, many kids had never seen a globe, didn't know what a planet

was, had never heard of Beethoven. Now they debate about space exploration and sing in school choirs. The difference is real, and it's generational. When you educate a child in a remote village, you're not just changing one life — you're breaking a cycle of poverty for an entire family.

Host (Li Hua): That's so true. Wang Lei?

Wang Lei: I think young couriers are the invisible backbone of modern China. We handle over 200 billion packages a year — that's more than any other country in the world. Behind every package is someone waiting for a birthday gift, a student waiting for textbooks, a patient waiting for medicine. We keep the economy moving. But beyond that, many young couriers are becoming community volunteers — helping elderly neighbors, reporting safety hazards during deliveries, even assisting in emergencies. I know a colleague who is hearing-impaired, and he delivers food every day with a smile. Young people in our field are proving that any job, no matter how ordinary it seems, can make an extraordinary difference.

Host (Li Hua): Chen Bo, what's your take?

Chen Bo: Young engineers in China are definitely making a difference, but I think we need to be honest about the challenges too. We're pushing boundaries in AI, quantum computing, and renewable tech, but the pressure is enormous. Many young engineers work 12-hour days and face burnout. However, what keeps us going is the belief that our work matters. When a rural doctor uses our AI tool and catches a disease early enough to save a life — that's not just making a difference. That's redefining what healthcare can be in a country of 1.4 billion people. We're proving that world-class technology doesn't have to stay in big cities. It can reach every corner of the nation.

Host (Li Hua): Liu Yan, last word on this question?

Liu Yan: I believe young environmental engineers are making one of the most critical differences of our time. China has committed to reaching carbon neutrality by 2060, and that goal cannot be achieved without young people. We're the generation that will have to live with the consequences of climate change, so we have the strongest motivation to act. Every solar panel we install, every ton of coal we replace with clean energy, every village we electrify with renewables — that's a tangible, measurable contribution to the nation's future. We're not just making a difference. We're safeguarding the future of China and the world.

Part III: Closing Remarks

Host (Li Hua): Thank you all so much. Before we wrap up, I'd like to ask each of you for one final message to the young people watching. Wang Lei?

Wang Lei: Don't underestimate the power of an ordinary job. Every package matters. Every smile matters. You don't need a fancy title to make a difference — you just need to care about what you do.

Host (Li Hua): Zhang Min?

Zhang Min: Go where you're needed most. The places that seem the hardest often give you the most back. I came to the mountains thinking I was helping others. Three years later, I realize the children here have changed me far more than I've changed them.

Host (Li Hua): Chen Bo?

Chen Bo: Stay curious and stay grounded. Technology is a tool, not an end. The real question isn't 'What can AI do?' — it's 'What problem can I solve for real people?' Never lose sight of the human being behind every line of code.

Host (Li Hua): Liu Yan?

Liu Yan: The future isn't something we wait for — it's something we build, one solar panel at a time. Find your passion, connect it to the needs of society, and don't be afraid to get your hands dirty. That's where real change begins.

Host (Li Hua): Beautifully said. Thank you, Wang Lei, Zhang Min, Chen Bo, and Liu Yan, for sharing your stories and your passion with us today. And thank you, our wonderful audience, for joining us on 'Young Voices, Real Impact.' Remember — no matter what you do, whether you deliver packages, teach children, write code, or install solar panels — you have the power to make a difference. Good night, everyone!

(Audience applauds. The host and guests stand and wave. Lights fade.)

— End of Talk Show Script —

Total estimated speaking time: 8–10 minutes
